The HR Diagram: A Laboratory Exercise

The HR Diagram Lab gives students the opportunity to construct an HR Diagram based on their own classifications of 119 stars.

This lab has four documents:

A document with a list of 119 stars with spectral classifications

A document with a list of 119 stars without spectral classifications

A blank graph page to plot the HR Diagram

A document with spectral types and absolute magnitudes of standard stars

A document with complete catalog information on the 119 stars

I. THE SPECTRA OF STARS: TEACHER COPY

Table 1 lists over 100 stars that can be observed with SCOPE and classified. Log into SCOPE and select the plate listed in column 1 of the table. Then, pick one of the stars. Note the name of star, and locate it in Table 1, where you will record your classification of the star. Complete as many of the stars as you can.

Once you're done classifying as many stars as you can, let's find out how many stars of each spectral type you've classified. Fill in the table below.

Spectral Type	O	B	A	F	G	K	M
Number of Stars	0 (0%)	38 (33%)	29 (25%)	12 (10%)	15 (14%)	15 (13%)	6 (5%)

Question: What is going on? Are there equal numbers of each spectral type? To answer this question, let's build a Hertzsprung-Russell Diagram.

Table 1. Stars to Classify from Their Spectra as observed with SCOPE

II. THE HERTZSPRUNG RUSSELL DIAGRAM

Once you have completed the classification of stars you observed with SCOPE, you can explore the natures of the stars by plotting the stars on the Hertzsprung Russell (HR) Diagram. You noticed that there is a larger number of G, K, and M stars, than O, B, and F.

Table 1 lists the Absolute Magnitudes (M_V) of the stars. Use those magnitudes and your classifications to plot on the graph below the Spectral Type versus the Absolute Magnitude. You will begin to notice the same thing astronomers notice – stars are not random, but are located in specific areas of the graph. What produces this trend? The answer gives us important clues to the masses, energies, and life cycles of stars.

III. The Nature of Stars.

Star	Spectral Type	Absolute Magnitude	Temperature (K)	Luminosity (x Sun)	Mass (x Sun)
Sun	G2V	4.8	6,000	1	1
Vega	A0V	0.6	9,600	79	2.1
Altair	A7V	2.3	8,000	6.3	2.0
Sirius	A1V	1.4	9,900	32	2.8
Arcturus	K2III	-0.2	4,100	100	4.5
Capella	G8	-0.6	5,200	0.6	0.8
Procyon	F5V	2.6	6,580	2.5	1.3
Aldeberan	K5III	-0.7	3,800	200	5.0
Spica	B1V	-3.2	25,000	1,000	15.8
Castor	A1	0.8	9,900	32	2.8
Antares	M1 I	-4.7	3,000	31,600	17.8

Plot the stars listed above on your HR Diagram. Look at the masses, temperatures, and luminosities. What trend do you notice in each of these stellar properties as a function of spectral type?

Now, go back to the stars you classified. How many are more massive than the Sun? How many are less massive? In the same way, compare the luminosities and temperatures of your stars to the Sun.

Summary: You can determine the basic properties of stars simply by looking at their spectra! Spectroscopy is an extremely powerful tool for astronomers.
